

Reading without losing your place

A sample paper for exploring the Paper Review workspace

Paper Review demonstration team | Example document | September 2026

About this sample

This four-page document exists only to demonstrate the interface. Its narrative, numbers, and bibliography are fictional. No participants were studied and no scientific conclusions should be drawn.

Abstract

Reviewing a manuscript can involve frequent movement between the main text, figures, and references. This sample provides a small document for trying a workspace with two independent views of the same PDF. A reviewer can keep the current paragraph on the left while inspecting a figure on the right.

Introduction

Consider the moment when a paragraph refers to Figure 1. In a single view, reaching the figure may require scrolling away from the argument. On returning, the reviewer needs to recover the previous reading position. The fictional sources [1, 2] are included to demonstrate the reference list.

A practical viewing task

Keep this page open in the left panel. In the right panel, move to page 3 and inspect Figure 1. Each panel should retain its own page and scroll position.

Read and compare

Figure 1 contains illustrative values across four example sessions. These values have no experimental meaning. They let you practice comparing a sentence with a nearby plot without interrupting your reading.

For example, you might ask whether the caption explains the units or whether Table 1 uses the same values as the figure. Both objects are deliberately placed on a different page from this paragraph.

Capture a review note

While the left panel is still on this page, start a comment in the notebook. A possible note is: "Please explain what the plotted units represent." The app records the left PDF page as private context when you begin the note.

Use the all-comments window to revise the wording. Exported comments should contain your review text without the automatically attached page tags. See the sample procedure on page 2 and references on page 4.

An illustrative review procedure

The steps below describe an interface demonstration, not a research protocol.

01

Open the document

Load this PDF in Paper Review. The app displays the same file in two independently scrollable panels. Your PDF is read locally by your browser.

02

Separate the reading positions

Leave the left panel on page 1. Move the right panel to page 3 using its page controls or scrollbar. Check that the left reading position stays in place.

03

Write and revisit a comment

Start a note while reading the left panel. The automatic page tag is private navigation information. Save the note, move elsewhere, and return to it from the comments list.

04

Inspect the references

Open the references popup and look for entries [1], [2], and [3]. The sample bibliography uses numbered fictional entries. Compare the extracted text with the original on page 4.

05

Prepare the review text

Open all comments, make an edit, and export a TXT file. Check that the edited text is present and the app-generated page tags are absent. Text you type yourself remains in the export.

Try your own review question

Does Figure 1 use the same example numbers as Table 1? Keep the text on the left while checking the answer on the right.

Figure and table workspace

All values below are invented for this demonstration.

Figure 1. Illustrative values across four example sessions

Caption: The points connect four invented numbers. The line is a visual guide only; it is not a statistical estimate or evidence of a treatment effect.

Table 1. Values used in Figure 1

Example session	Illustrative value	Interpretation
1	12	Demonstration only
2	18	Demonstration only
3	16	Demonstration only
4	29	Demonstration only

Navigation check: return to the paragraph about Figure 1 on page 1 without moving this panel away from the figure.

References

The following entries are fictional. They demonstrate reference extraction and citation matching; they should not be cited or treated as real publications.

[1] Example, A., and Sample, B. (2026). Keeping text and figures in view during paper review. Fictional Journal of Review Workflows, 1, 1-4. Fictional demonstration reference.

[2] Sample, C. (2026). Independent reading positions in a split document workspace. Fictional Methods Notebook, 2, 10-14. Fictional demonstration reference.

[3] Demo, D., and Example, E. (2026). Reviewer notes and private page context. Fictional Proceedings of Practical Reading, 3, 20-24. Fictional demonstration reference.

Appendix

Locate citation [2] in the list above. The popup should let you inspect its full entry while both PDF panels retain their reading positions. Because these entries are fictional, they are not intended for external literature searches.

A real manuscript may use numbered or author-year citations. Extracted entries should be checked against the PDF, particularly when the bibliography spans multiple columns or pages.

This sample contains selectable text. A scanned PDF may require local OCR before reference text can be extracted.
